3d-Earliest Deadline First

Antonio Camacho Santiago antonio.camacho.santiago@upc.edu

### Objective

To understand Earliest Deadline First (EDF) schedulers...

To design Earliest Deadline First schedulers...

To analyze Earliest Deadline First ...

To evaluate the pros and cons of Earliest Deadline First schedulers...

```
at design stage:
  nothing to do (just check feasibility)

at runtime each Sys_Tick:
  for each active task
    dispatch the task with shorter absolute deadline
```

### EDF scheduler

At run-time, absolute deadlines of active tasks are checked and priorities are online modified

$$\forall t, \tau_i, \tau_j : d_i < d_j \Rightarrow P_i > P_j$$

It can also be used the following rule saying that priorities are assigned proportionally to the inverse of the absolute deadline

$$P_i \propto \frac{1}{d_i}$$

Note that absolute deadline is  $d_i = \phi_i + kT_i + D_i$  where  $\phi_i$  is the initial phase, k is a positive integer,  $T_i$  is the task period and  $D_i$  is the relative deadline

At each system tick, the scheduler looks for the existing active tasks to dispatch the task with higher priority. Thus, preemption is allowed at each system tick

More details can be found in S.K.Baruah, L. E: Rosier and R. R Howell, "Algorithms and complexity concerning the preemptive scheduling of periodic, real-time tasks on one processor," Journal of Real Time Systems, n. 2, 1990

### Requisites

The approach for the earliest deadline first scheduler is based on periodic tasks as follows:

1 microprocessor

Tasks may arrive at any time

The WCET for each task is known, fitted and less than its deadline

Deadlines of each task are less or equal to their periods

Periodic (simple feasibility test) or aperiodic tasks (processor demand test)

EDF for no precedence among tasks or EDF\* when precedence exists

Tasks can be preempted

RT kernel uses dynamic priorities

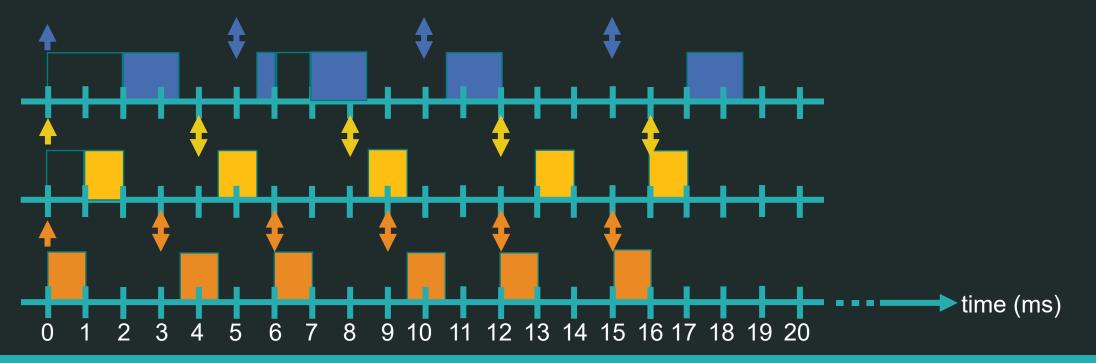

The schedulability analysis tries to know in advance if all the release times for each task occurs before its deadline.

# EDF-Periodic tasks $T_i = D_i$

#### 3d-Earliest Deadline First

Typical periodic task set with  $T_i = D_i$ 

Task τ <sub>i</sub>	Computing time c <sub>i</sub> (ms)	Period T <sub>i</sub> = Deadline D <sub>i</sub> (ms)			
$\tau_1$	1	3			
$\tau_2$	1	4			
$\tau_3$	1.5	5			

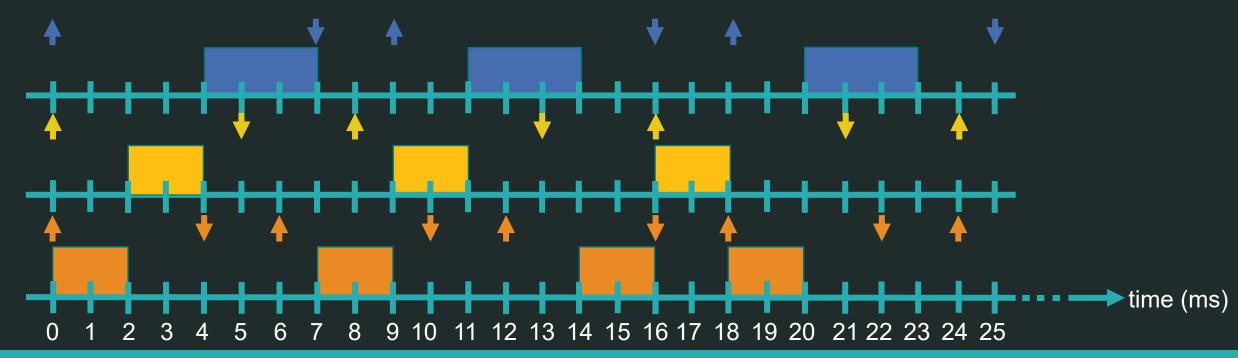

# EDF-Periodic tasks $T_i \le D_i$

#### 3d-Earliest Deadline First

Periodic task set with  $T_i \le D_i$ 

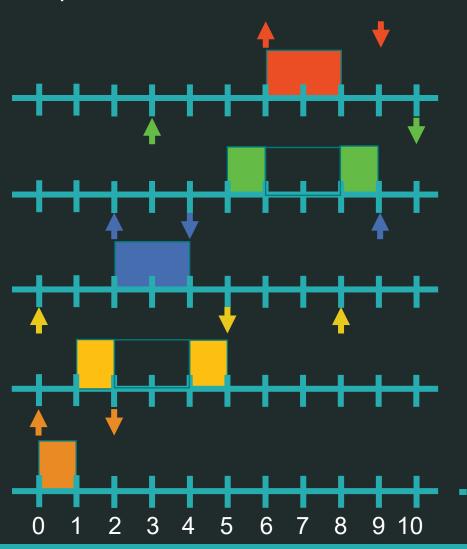

Task τ <sub>i</sub>	Computing time c <sub>i</sub> (ms)	Deadline D <sub>i</sub> (ms)	Period T <sub>i</sub> (ms)
$\tau_1$	2	4	6
$\tau_2$	2	5	8
$\tau_3$	3	7	9

# EDF-Aperiodic tasks

#### 3d-Earliest Deadline First

Aperiodic tasks with different arrival times

Task τ <sub>i</sub>	Computing time c <sub>i</sub> (ms)	Deadline d <sub>i</sub> (ms)	Arrival a <sub>i</sub> time (ms)
$\tau_1$	1	2	0
$\tau_2$	2	5	0
$\tau_3$	2	4	2
$\tau_4$	2	10	3
τ <sub>5</sub>	2	9	6

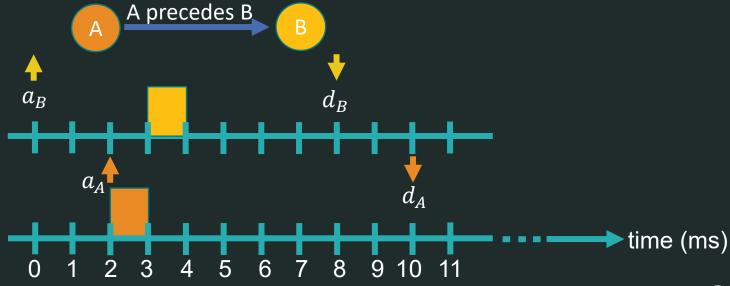

Absolute deadline (d<sub>i</sub>) instead of Relative deadline (D<sub>i</sub>)

time (ms)

### EDF\*-precedence constraints

### 3d-Earliest Deadline First

Until now EDF has no precedence constraints. In case  $\tau_A \rightarrow \tau_B$  then EDF becomes EDF\*

POSTPONE SUCCESSOR ARRIVAL TIME:

$$a_B^* = a_A + C_A$$

ADVANCE DEADLINE OF PRECESSOR:

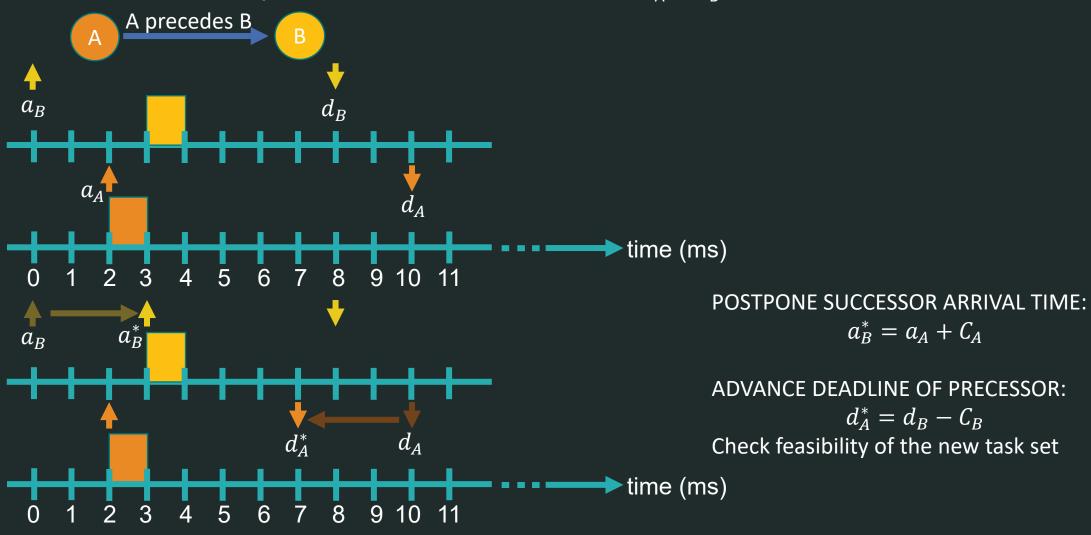

$$d_A^* = d_B - C_B$$

Check feasibility of the new task set

### EDF\*-precedence constraints

### 3d-Earliest Deadline First

Until now EDF has no precedence constraints. In case  $\tau_A \rightarrow \tau_B$  then EDF becomes EDF\*

Generic approach for complex precedence paths:

Transform a set J of dependent tasks into a set J\* of independent tasks

Arrival time modification:

- 1 For all root nodes, set  $a_i^* = a_i$
- 2 Select a task  $\tau_i$  such that all its immediate predecessors have been modified, else exit.

$$3 \operatorname{Set} a_i^* = \max \left\{ a_i, \max_{\mathsf{\tau}_k \to \mathsf{\tau}_i} (a_k^* + C_k) \right\}$$

4 Repeat from line 2.

#### Deadline modification

- 1 For all leaves, set  $d_i^* = d_i$
- 2 Select a task  $\tau_i$  such that all its immediate successors have been modified, else exit.

$$3 \operatorname{Set} d_i^* = \min \left\{ d_i, \min_{\mathsf{T}_k \to \mathsf{T}_i} (d_k^* - C_k) \right\}$$

4 Repeat from line 2.

### Online test for accepting a new task

#### 3d-Earliest Deadline First

How to online check if a new task can be scheduled at runtime?

Let J be the set of current guaranteed task Let  $J_{\text{new}}$  be the new task that has arrived To accept  $J_{\text{new}}$  U J = J' must be schedulable J' is schedulable iff  $\forall i = 1, 2, ..., n$ :  $f_i \leq d_i$ 

Task τ <sub>i</sub>	Computing time c <sub>i</sub> (ms)	deadline d <sub>i</sub> (ms)	Arrival time a <sub>i</sub> (ms)
$\tau_{1}$	4	11	0
τ <sub>2</sub>	2	9	3
$\tau_2$	4	10	1
$\tau_{new}$	2	8	4

where  $f_i = \sum_{k=1}^n c_k$ , being  $c_i$  the remaining Worst Case Execution Time of task  $J_i$ The online test consists of checking the n-conditions at the arrival times, ordering the tasks by increasing deadlines

There is no space to accommodate the new task (green) without missing deadline for task 1

### Online test for accepting a new task

#### 3d-Earliest Deadline First

How to online check if a new task can be scheduled at runtime?

$$t = 0, J_1: C_1(0) = 4 \le 11 - 0 = d_1 - t$$

$$t = 1, J_3: C_3(1) = 4 \le 10 - 1 = d_3 - t$$

$$J_1: C_3(1) + C_1(1) = 4 + 3 = 7 \le 10$$

$$t = 3, J_2: C_2(3) = 2 \le 9 - 3 = d_2 - t$$

Task τ <sub>i</sub>	Computing time c <sub>i</sub> (ms)	deadline d <sub>i</sub> (ms)	Arrival time a <sub>i</sub> (ms)
$\tau_1$	4	11	0
$\tau_2$	2	9	3
$\tau_3$	4	10	1
$\tau_{new}$	2	8	4

$$J_3: C_2(3) + C_3(3) = 2 + 2 \le 10 - 3 = d_3 - t$$

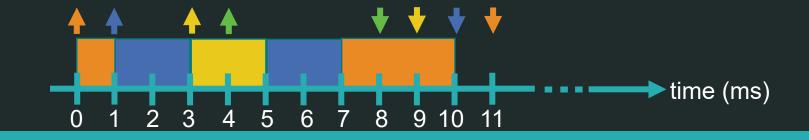

$$J_1: C_2(3) + C_3(3) + C_1(3) = 2 + 2 + 3 \le 11 - 3 = d_1 - t$$

$$t = 4, J_4: C_4(4) = 2 \le 8 - 4 = d_4 - t$$

$$J_2$$
:  $C_4(4) + C_2(4) = 2 + 1 \le 9 - 4 = d_2 - t$ 

$$J_3$$
:  $C_4(4) + C_2(4) + C_3(4) = 2 + 1 + 2 \le 10 - 4 = d_3 - t$ 

$$J_1: C_4(4) + C_2(4) + C_3(4) + C_1(4) = 2 + 1 + 2 + 3 = 8 \ge 7 = 11 - 4 = d_1 - t$$
 Not feasible (as shown in the plot)

For periodic tasks with  $D_i = T_i$  check feasibility as

That's all folks!! 
$$U_{\text{total}} = \sum_{i=1}^{n} U_i \le 1$$
 (necessary and sufficient condition)

For periodic tasks with  $D_i < T_i$  check feasibility using processor demand as

$$L \ge \sum_{i=1}^{n} \left( \left\lfloor \frac{L - D_i}{T_i} \right\rfloor + 1 \right) C_i$$
 (necessary and sufficient condition)

Note that condition  $L \ge \sum_{i=1}^n \left| \frac{L}{T_i} \right| C_i$  based on processor demand analysis is the same as  $U_{\text{total}} = \sum_{i=1}^n U_i \le 1$  when  $D_i = T_i$ 

Processor demand criterion: In any interval, the computation demanded by the task set must be no greater than the available time.

$$g(t_1, t_2) = \sum_{\substack{r_{i,k} \ge t_1, \\ d_{i,k} \le t_2}} C_i$$

The set of tasks is feasible if in any interval of time, the processor demand does not exceed the available time

$$\forall t_1, t_2: g(t_1, t_2) \leq t_1 - t_2$$

Problem: how to perform the test. Solution: find instances of  $\tau_i$  contributing in  $[t_1, t_2]$ 

$$g(t_1, t_2) = \sum_{i=1}^{n} \eta_i(t_1, t_2) C_i = \sum_{i=1}^{n} \max \left( 0, \left\lfloor \frac{t_2 + T_i - D_i}{T_i} \right\rfloor - \left\lceil \frac{t_1}{T_i} \right\rceil \right) C_i$$

Assumption: initial phase  $\forall i$ :  $\phi_i = 0$ 

$$g(0,L) = \sum_{i=1}^{n} \eta_i(0,L) C_i = \sum_{i=1}^{n} \left[ \frac{L + T_i - D_i}{T_i} \right] C_i$$

where L is the final time interval. Schedulability is ensured iff  $g(0,L) \leq L$ 

### **Processor Demand Analysis**

The test with assumption  $\phi_i$ =0 is simplified for  $D_i$ = $T_i$ 

$$g(0,L) = \sum_{i=1}^{n} \left\lfloor \frac{L}{T_i} \right\rfloor C_i \le L$$

How many test need to be analyzed for L? The function g(0,L) is stepwise constant between two deadlines. Therefore, check only at deadline intervals. Moreover check along the hyperperiod.

A set of tasks with  $\phi_i$ =0,  $D_i \le T_i$  is EDF-feasible iff

$$g(0,L) \le L$$
 with  $D = \{d_k | d_k \le \min(H, L^*)\}$  
$$H = \operatorname{lcm}(T_1, T_2, \dots, T_n)$$
 
$$L^* = \frac{\sum_{i=1}^n (T_i - D_i) U_i}{1 - U}$$

### **Processor Demand Analysis**

#### 3d-Earliest Deadline First

Processor utilization

$$U = \sum_{i=1}^{n} U_i = \frac{2}{6} + \frac{2}{8} + \frac{3}{9} = \frac{11}{12} \le 1$$

$$H = \text{lcm}(T_1, T_2, \dots, T_n) = 72$$

$$L^* = \frac{\sum_{i=1}^{n} (T_i - D_i) U_i}{1 - U} = 25$$

Task τ <sub>i</sub>	Computing time c <sub>i</sub> (ms)	Deadline D <sub>i</sub> (ms)	Period T <sub>i</sub> (ms)
$\tau_1$	2	4	6
$\tau_2$	2	5	8
$\tau_3$	3	7	9

Conditions should be evaluated at

$$D = \{d_k | d_k \le \min(H, L^*)\} \le 25 = \{4, 5, 7, 10, 13, 16, 21, 22, 25\}$$

Test is 
$$g(0,L) = \sum_{i=1}^{n} \left| \frac{L + T_i - D_i}{T_i} \right| C_i \le L$$

L	4	5	7	10	13	16	21	22	25
g(0,L)	2	4	7	9	11	16	18	20	23
Test <i>g</i> (0, <i>L</i> ) ≤ <i>L</i>	OK								

### EDF scheduler

#### Pros:

The earliest deadline first scheduler is based on dynamic priorities configured at runtime according to the absolute deadline of each task

Sufficient condition for  $T_i = D_i$  and periodic tasks  $U_{\text{total}} \leq 1$ 

For aperiodic tasks, check demand processor criterion

Optimality: among all the algorithms, EDF is optimal in terms of feasibility

if some feasible schedule exists, EDF will find it. EDF minimizes the maximum latency.

Note that EDF is not optimal in systems where no preemption is allowed

#### Cons:

EDF is not provided by any commercial RTOS!

It is less predictable and less controllable when trying to reduce response time

It requires higher overhead compared with fixed priorities schedulers

During overload, all tasks can miss their deadline (domino effect)
